

## **Fluid-structure interaction: Methods and applications**

The mini-symposium focus on advances in computational fluid-structure interaction (FSI) problems. The presentations will cover a wide range of applications, including aerodynamics, renewable energy (e.g. wind turbines, land and airborne, wave energy converters, hydro-power), biomedicine, aerospace and aerodynamics, civil engineering (bridges and buildings).

The topics to be discussed include:

- Partitioned and staggered methodologies
- Embedded and Arbitrary Lagrangian-Eulerian methods
- Multiphysics coupling methods
- High Performance Computing in FSI
- Theoretical developments in FSI and moving boundaries
- Industrial applications
